

To Potential Mentors,

I am Devansh Chauhan, a second year student from India. I came across the Linux Foundation Mentorship Program through LinkedIn, and I am interested in this project as it closely aligns with my technical skill set and core interests in web development.

I am passionate about contributing to open source and engaging with developer communities across the globe. I believe that active open-source contribution not only helps the community but also strengthens my skills and builds a strong foundation for future career opportunities.

The proposed problem of rebuilding the entire frontend using the Carbon Design System particularly excites me. I have a strong interest in frontend development using React and JavaScript, and I am eager to learn and implement the Carbon Design System as part of this project.

Previously, I have contributed to the open-source project AsyncAPI, where I worked on tasks such as setting up the frontend, implementing React props, functionalities, and hooks, and improving overall UI behaviour.

Through this project, I aim to gain a deep understanding of the Carbon Design System and learn how to build advanced, production-grade frontend applications using React, while becoming more effective at contributing to open-source projects.

Regards,
Devansh Chauhan
